

In the claims:

1. (currently amended) Apparatus in an access point in a wireless communications environment including multiple access points and stations, wherein stations gain network access by associating with one or more of the access points, comprising:

logic for receiving messages from stations indicative of a request to associate with the access point;

logic for keeping track of one or more parameters related to the stations from which the messages have been received in the network;

logic for evaluating the one or more parameters to produce an evaluation; and

logic for selecting one of the stations from which the message was received causing a station to become associated with the access point based upon the evaluation in order to gain network access to communicate with other stations via the access point.

2. (original) The apparatus of claim 1 wherein the logic for keeping track includes logic for receiving messages from stations, and wherein the messages include at least some of the one or more parameters.

3. (original) The apparatus of claim 2 wherein a parameter is the number of stations associated with the access point.

4. (previously presented) The apparatus of claim 2 wherein a parameter is the distance of a station from the access point.

5. (original) The apparatus of claim 4 wherein at least some of the one or more parameters are stored in a table.

6. (currently amended) Apparatus in an access point in a wireless communications environment including multiple access points and stations, wherein stations gain network access by associating with one or more of the access points, comprising:

logic for receiving messages from stations indicative of a request to associate with the access point;

logic for keeping track of one or more parameters related to stations from which the messages have been received in the network, ~~wherein the logic for keeping track includes logic for receiving messages from stations, and~~ wherein the messages include at least some of the one or more parameters;

wherein a parameter may be the number of stations associated with the access point, and wherein another parameter may be the distance of a station from the access point; ~~and~~

logic for evaluating the one or more parameters to produce an evaluation; and

logic for selecting one of the stations from which the message was received ~~causing a station~~ to become associated with the access point based upon the evaluation ~~in order to gain network access to communicate with other stations via the access point.~~
